

Milestone 1 Documentation

Name: Mohammed Junaid Betgeri

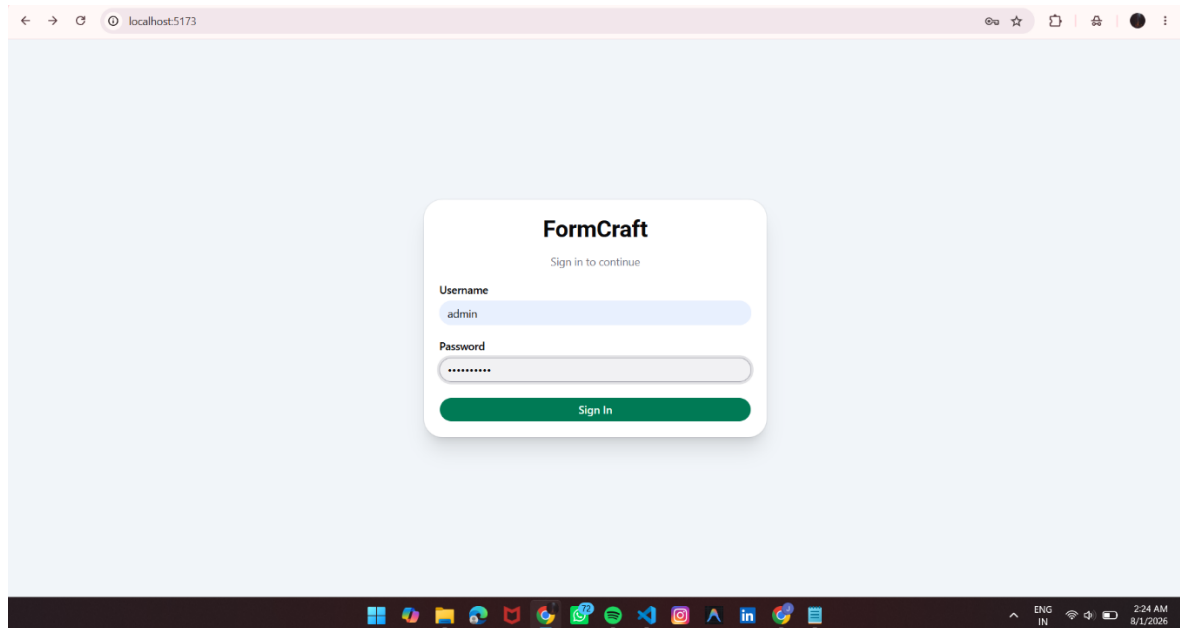

Mail: jemir0019@gmail.com

Project: Low-Code Dynamic Form Workflow & Data Collection Platform

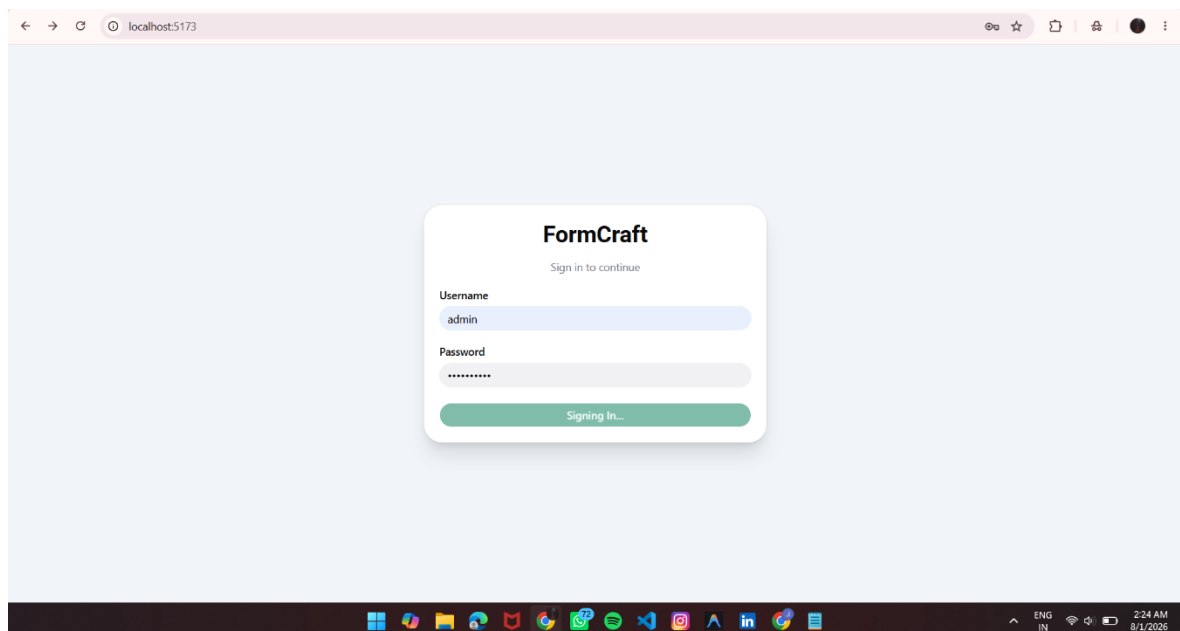

Overview about the Milestone 1:

Milestone 1 focused on building the core backend foundation of the platform. It included designing the PostgreSQL database schema, implementing the field type library, developing Form CRUD APIs, enabling form versioning, and generating shareable links for published forms. This milestone established the essential infrastructure for future modules such as conditional logic and response management.

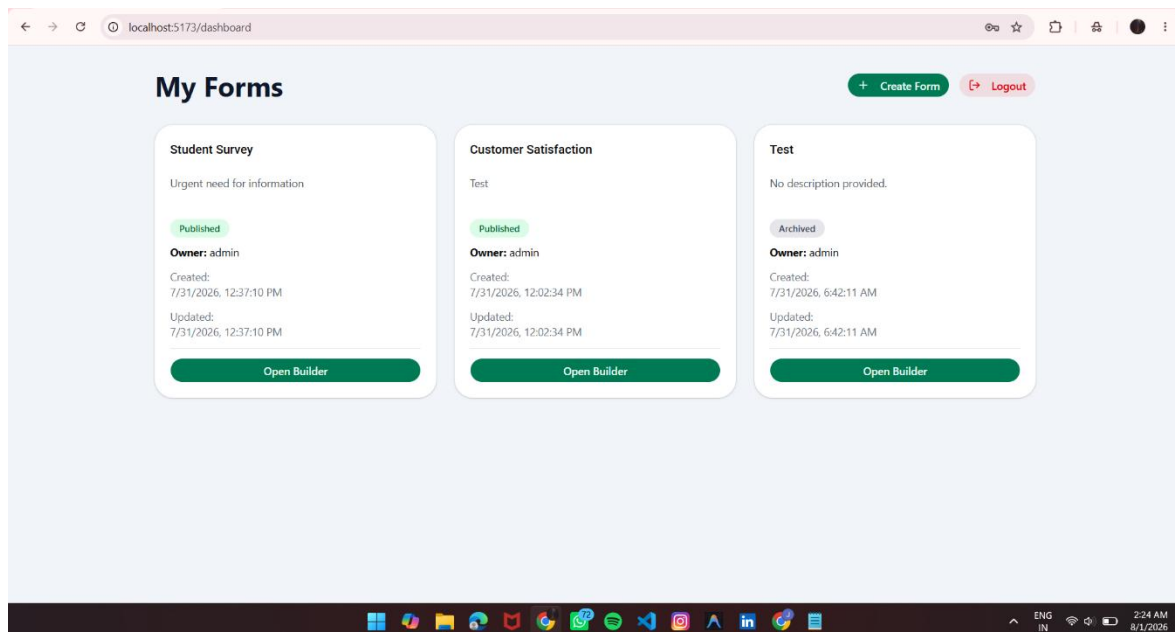

Following is the Screenshot with their brief explanation:

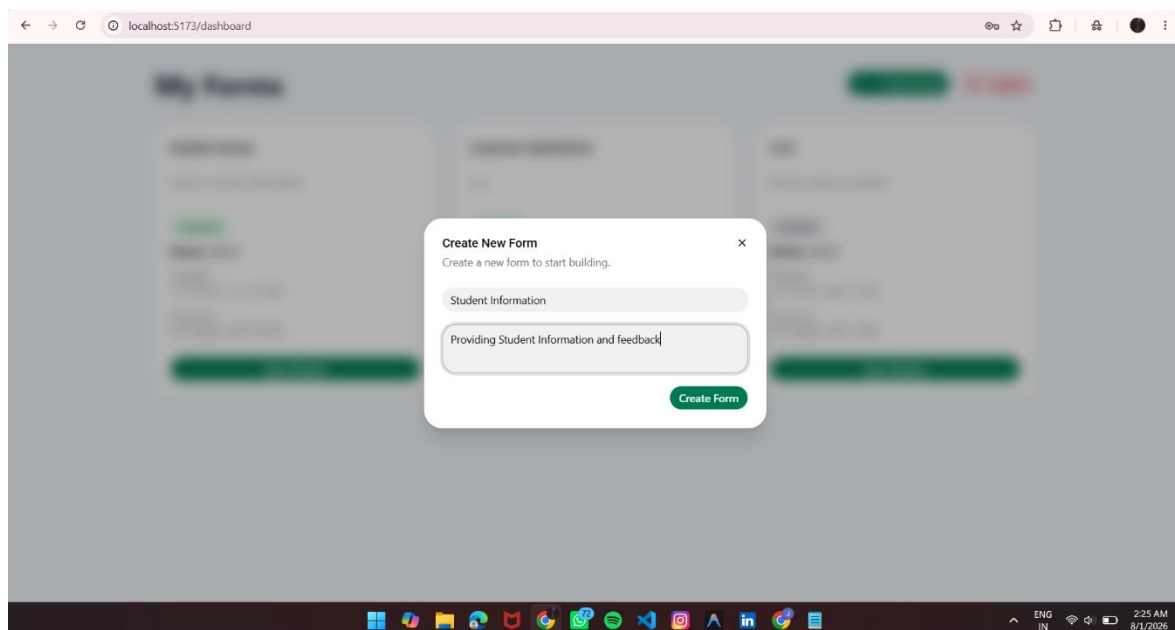

1. Sign in Page of the Form, as in the database created superuser admin and password

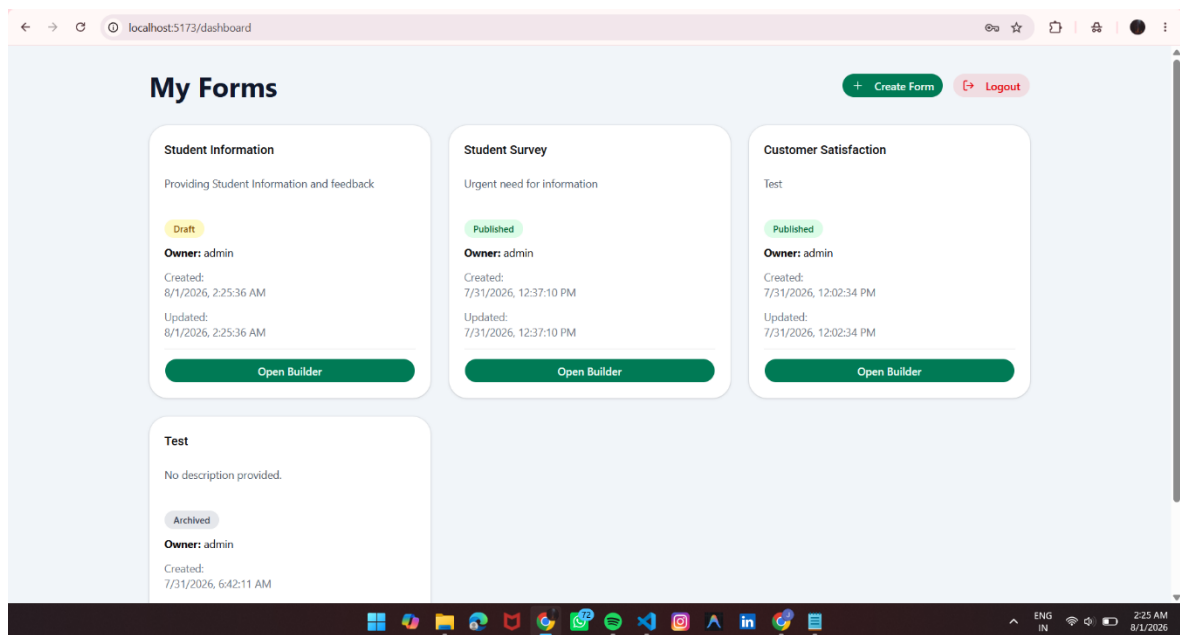

2. Once the details are entered, can click on Sign in the button turns into animation signing in.

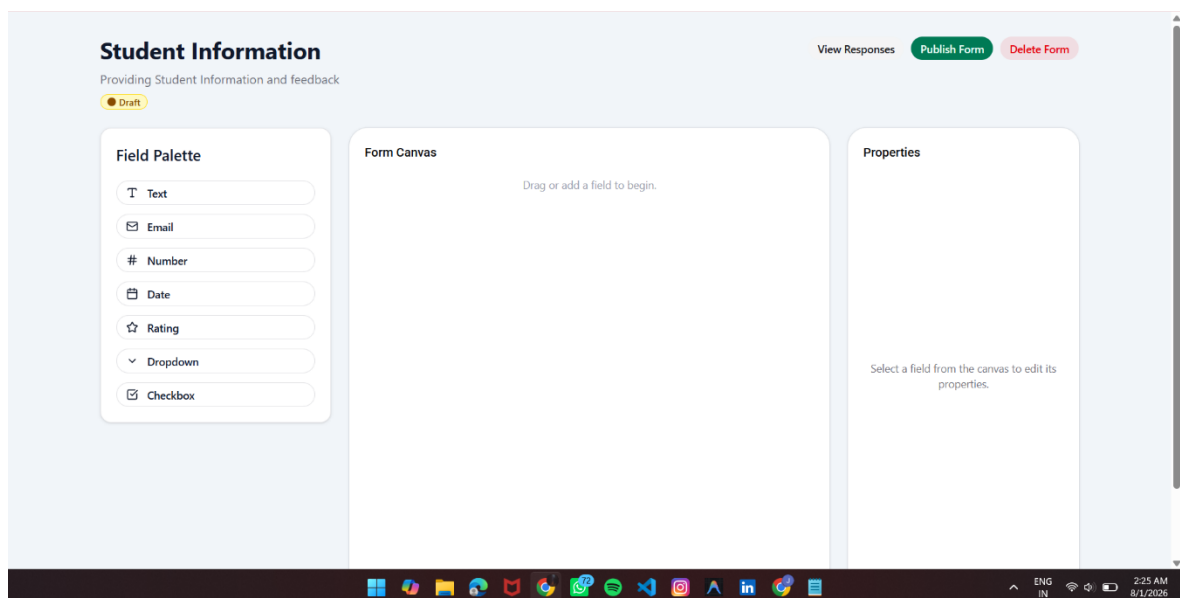

- Once Signed in the user can see the already available forms preview with their status badge that says (Draft, Published, Archived). Also available two options for logging out and creating a new form.

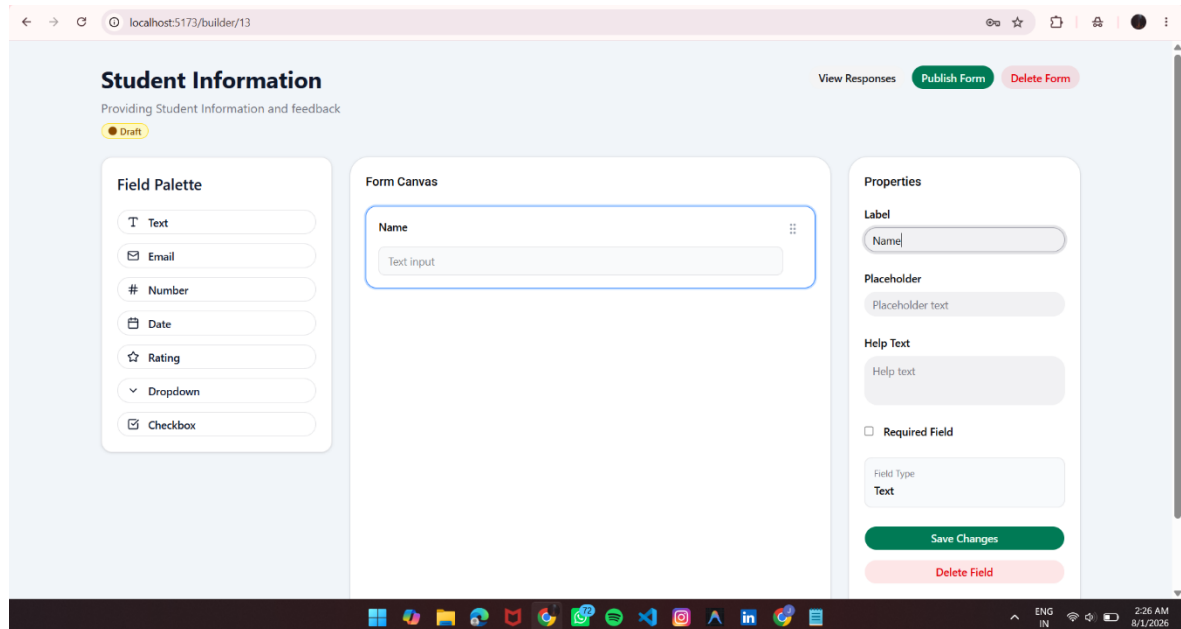

- Clicking on the Create Form, opens a modal/dialog box asking the Title of the form and its description.

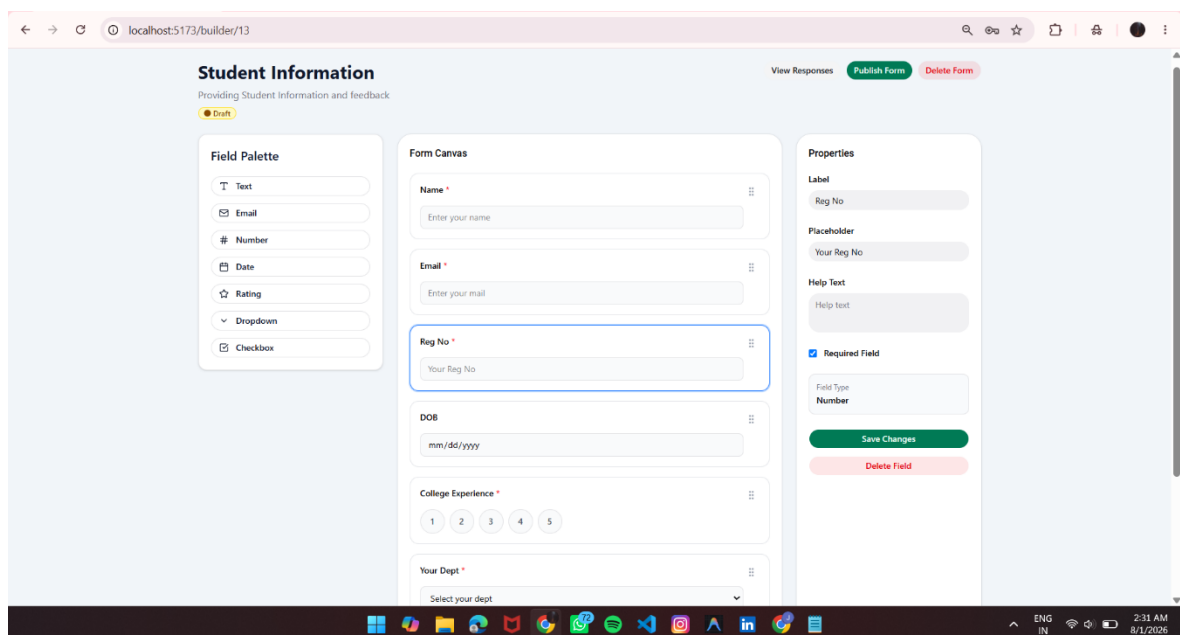

- After clicking on create form with title and description the newly created form will appear in the My Forms section as can see in the above screenshot.

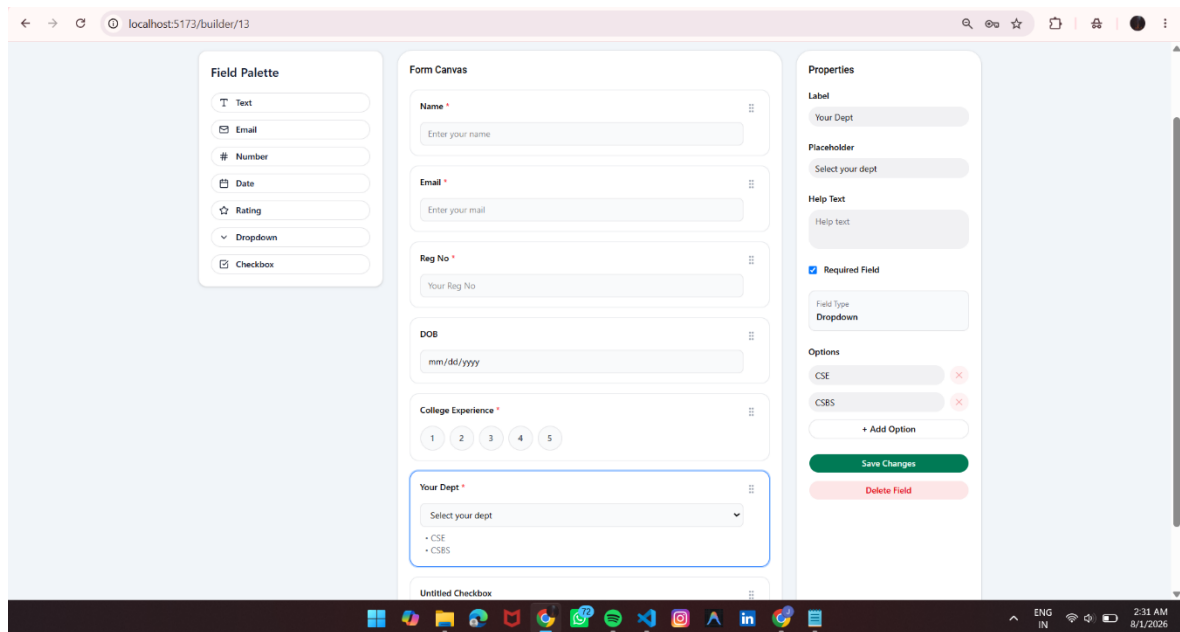

- Once creating form the user can open the particular form builder to customer the form according to their needs and useful, the left side shows the Field Palette, and in the right side it shows the properties of that field, the middle section is canvas where field are shown and can be dragged up and above also

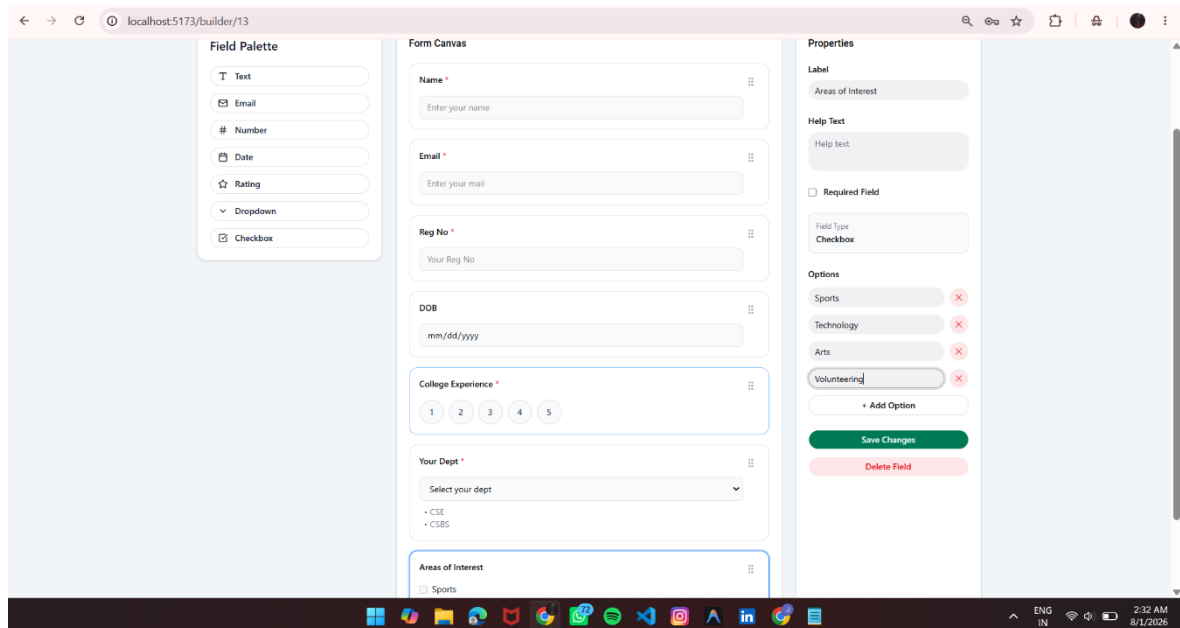

- As mentioned in the previous screenshot the right shows the properties of the particular field we it can be modified

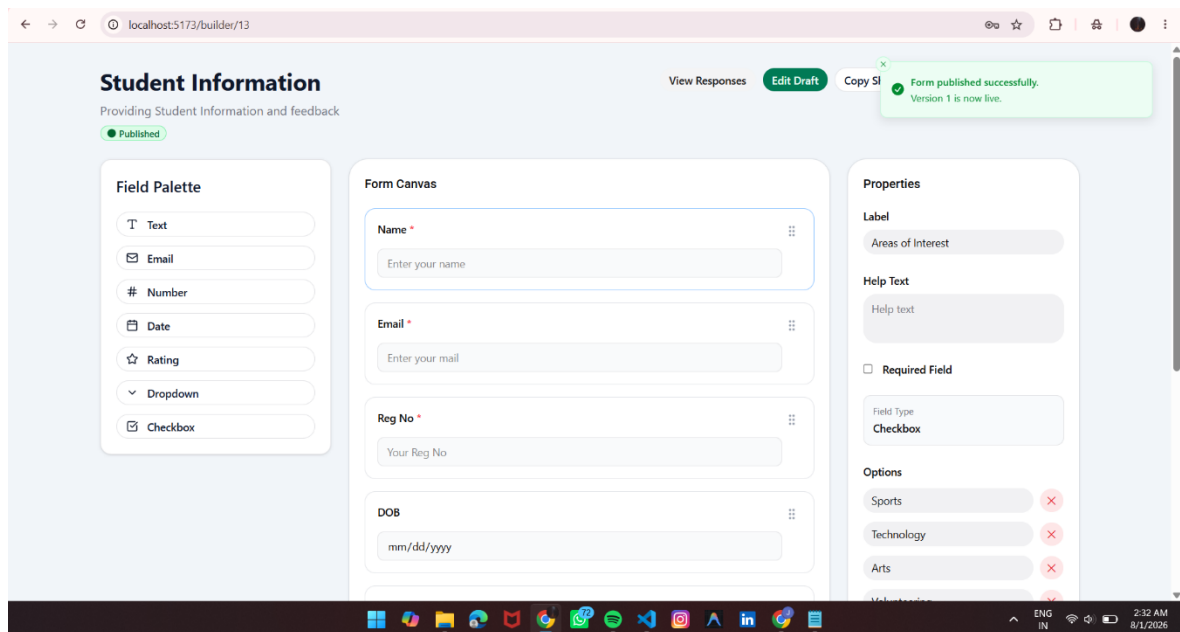

- Created multiple fields for the form Student Information with customizing their properties

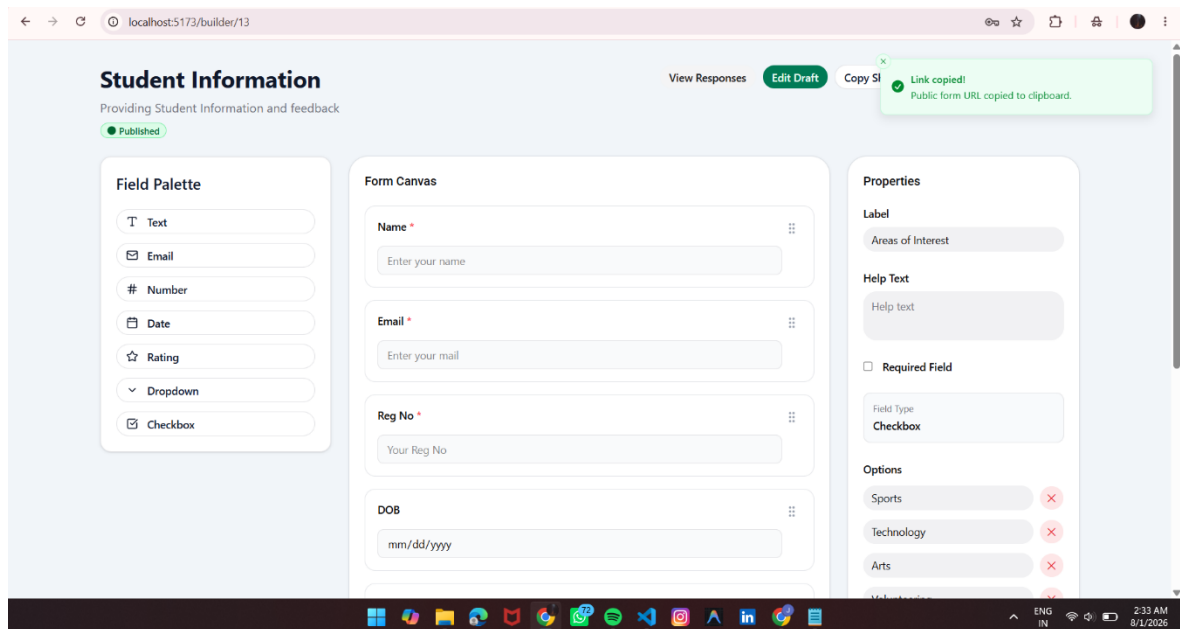

9. Added specific properties based on the type of field like Dropdown with multiple option system.

10. Also add the checkbox field with its particular customizable properties system.

11. Once clicked on Publish Form option the form is posted live with status turned into the published and right side top corner a dialog box appears says (Form published successfully).

12. Once published the user can copy the share link of that form, as you can see in the above screenshot, a dialog appears says Link Copied.

Submit

15. Once the details are filled the user can click on the submit button, as you see * symbol which means required mandatory data, if keeping it null and clicking on submitting, the form throws an error saying required data needs to be filled.

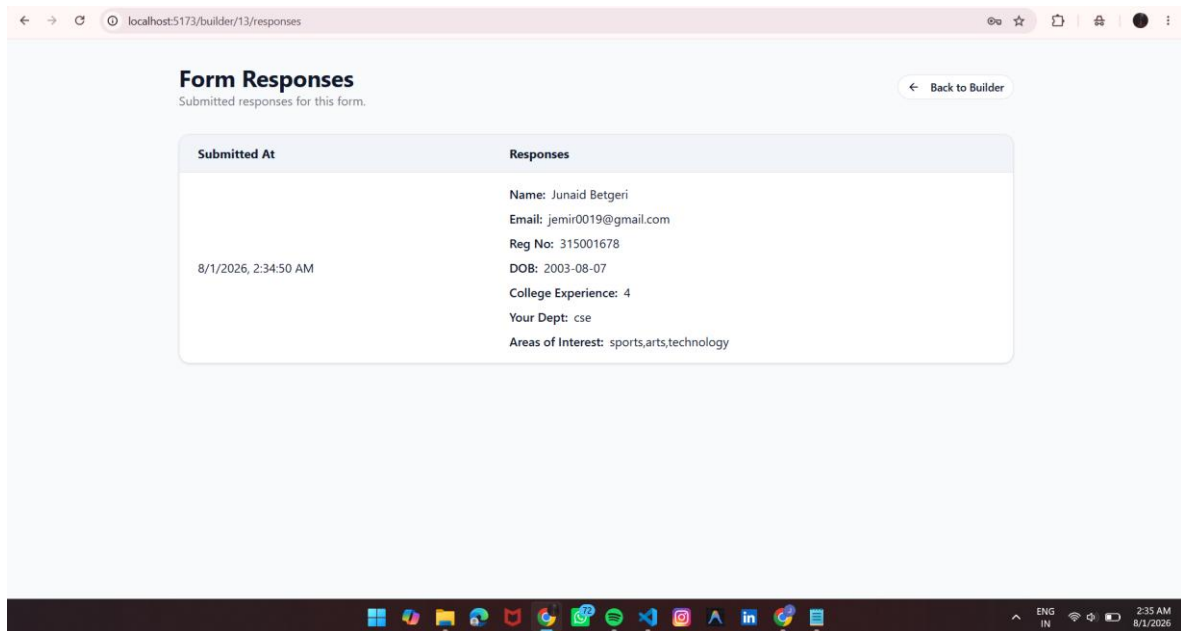

Form submitted successfully!

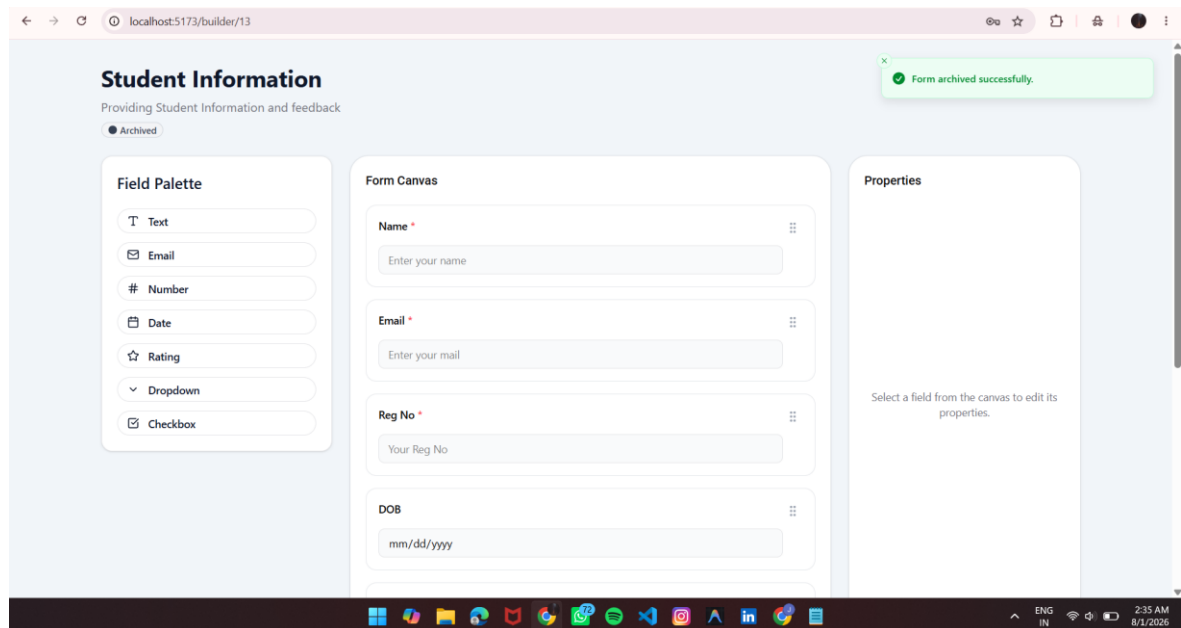

Submission Successful!

Thank you for completing the form.
Your response has been recorded successfully.

16. Once clicked on Submit button the form is submitted successfully, and it redirect to the success page indicating that form is submitted.

17. Going back to the form builder of the user (admin) who created the form can see the option as view response there the admin user can see the responses of the students (Public users).

18. In builder once clicked on the Archived option the form is archived and can't be used further as seen in the screenshot the status badge is turned into the Archived, also all the other options are gone too like edit, view response.
